

The naked truth about grids

Grid systems are nice. But you have to understand them well before implementing in your project.

Who is Andrey:

- Drupal user and developer for over 9 years (D.o. id=920!)
- Mostly into site architecture, themes and consulting.
- Dozens of sites created internationally.
- Happily serving community as drupalsites.net guy.
- Their new project to come soon: nood.org, a place to find stock Drupal themes.
- + my blog: andreys.info with links to twitter, flickr etc.

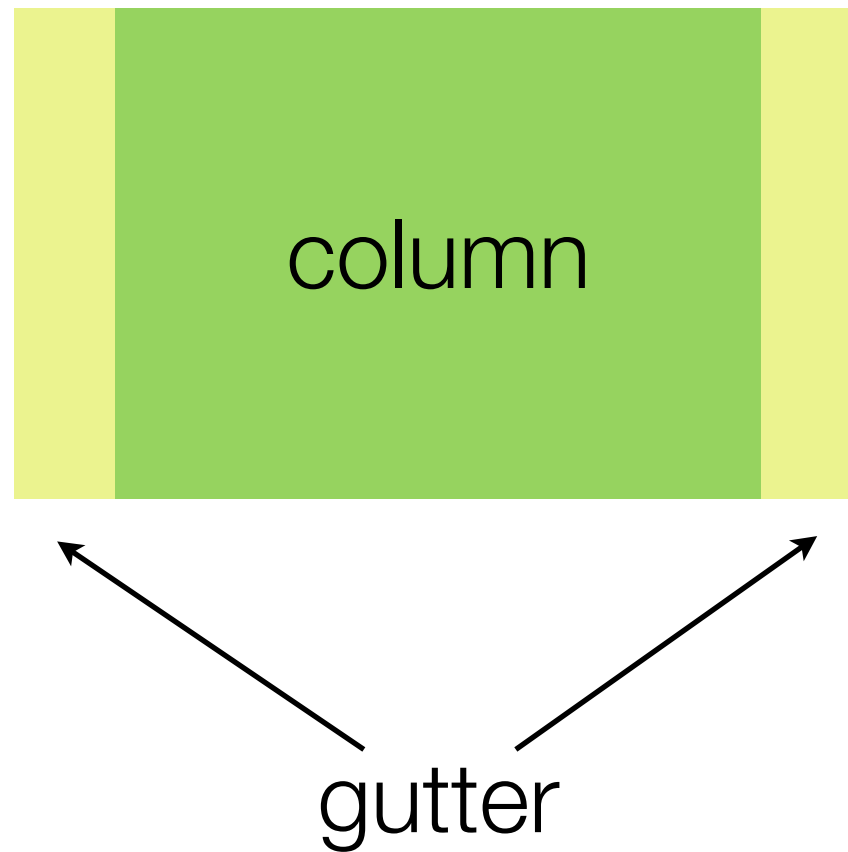

Short introduction to grids

For those who don't use it yet

Most popular grid systems

- **960.gs** (<http://960.gs/>). Usually 12 or 16 column layout.
- **Blueprint** (<http://www.blueprintcss.org/>) and **Bluetrip** (<http://bluetrip.org/>) with 24 column layout.
- **1kb Grid** (<http://www.1kbgrid.com/>)
- **Golden Grid** (<http://code.google.com/p/the-golden-grid/>)
- and much much more....

Grid basics: the column

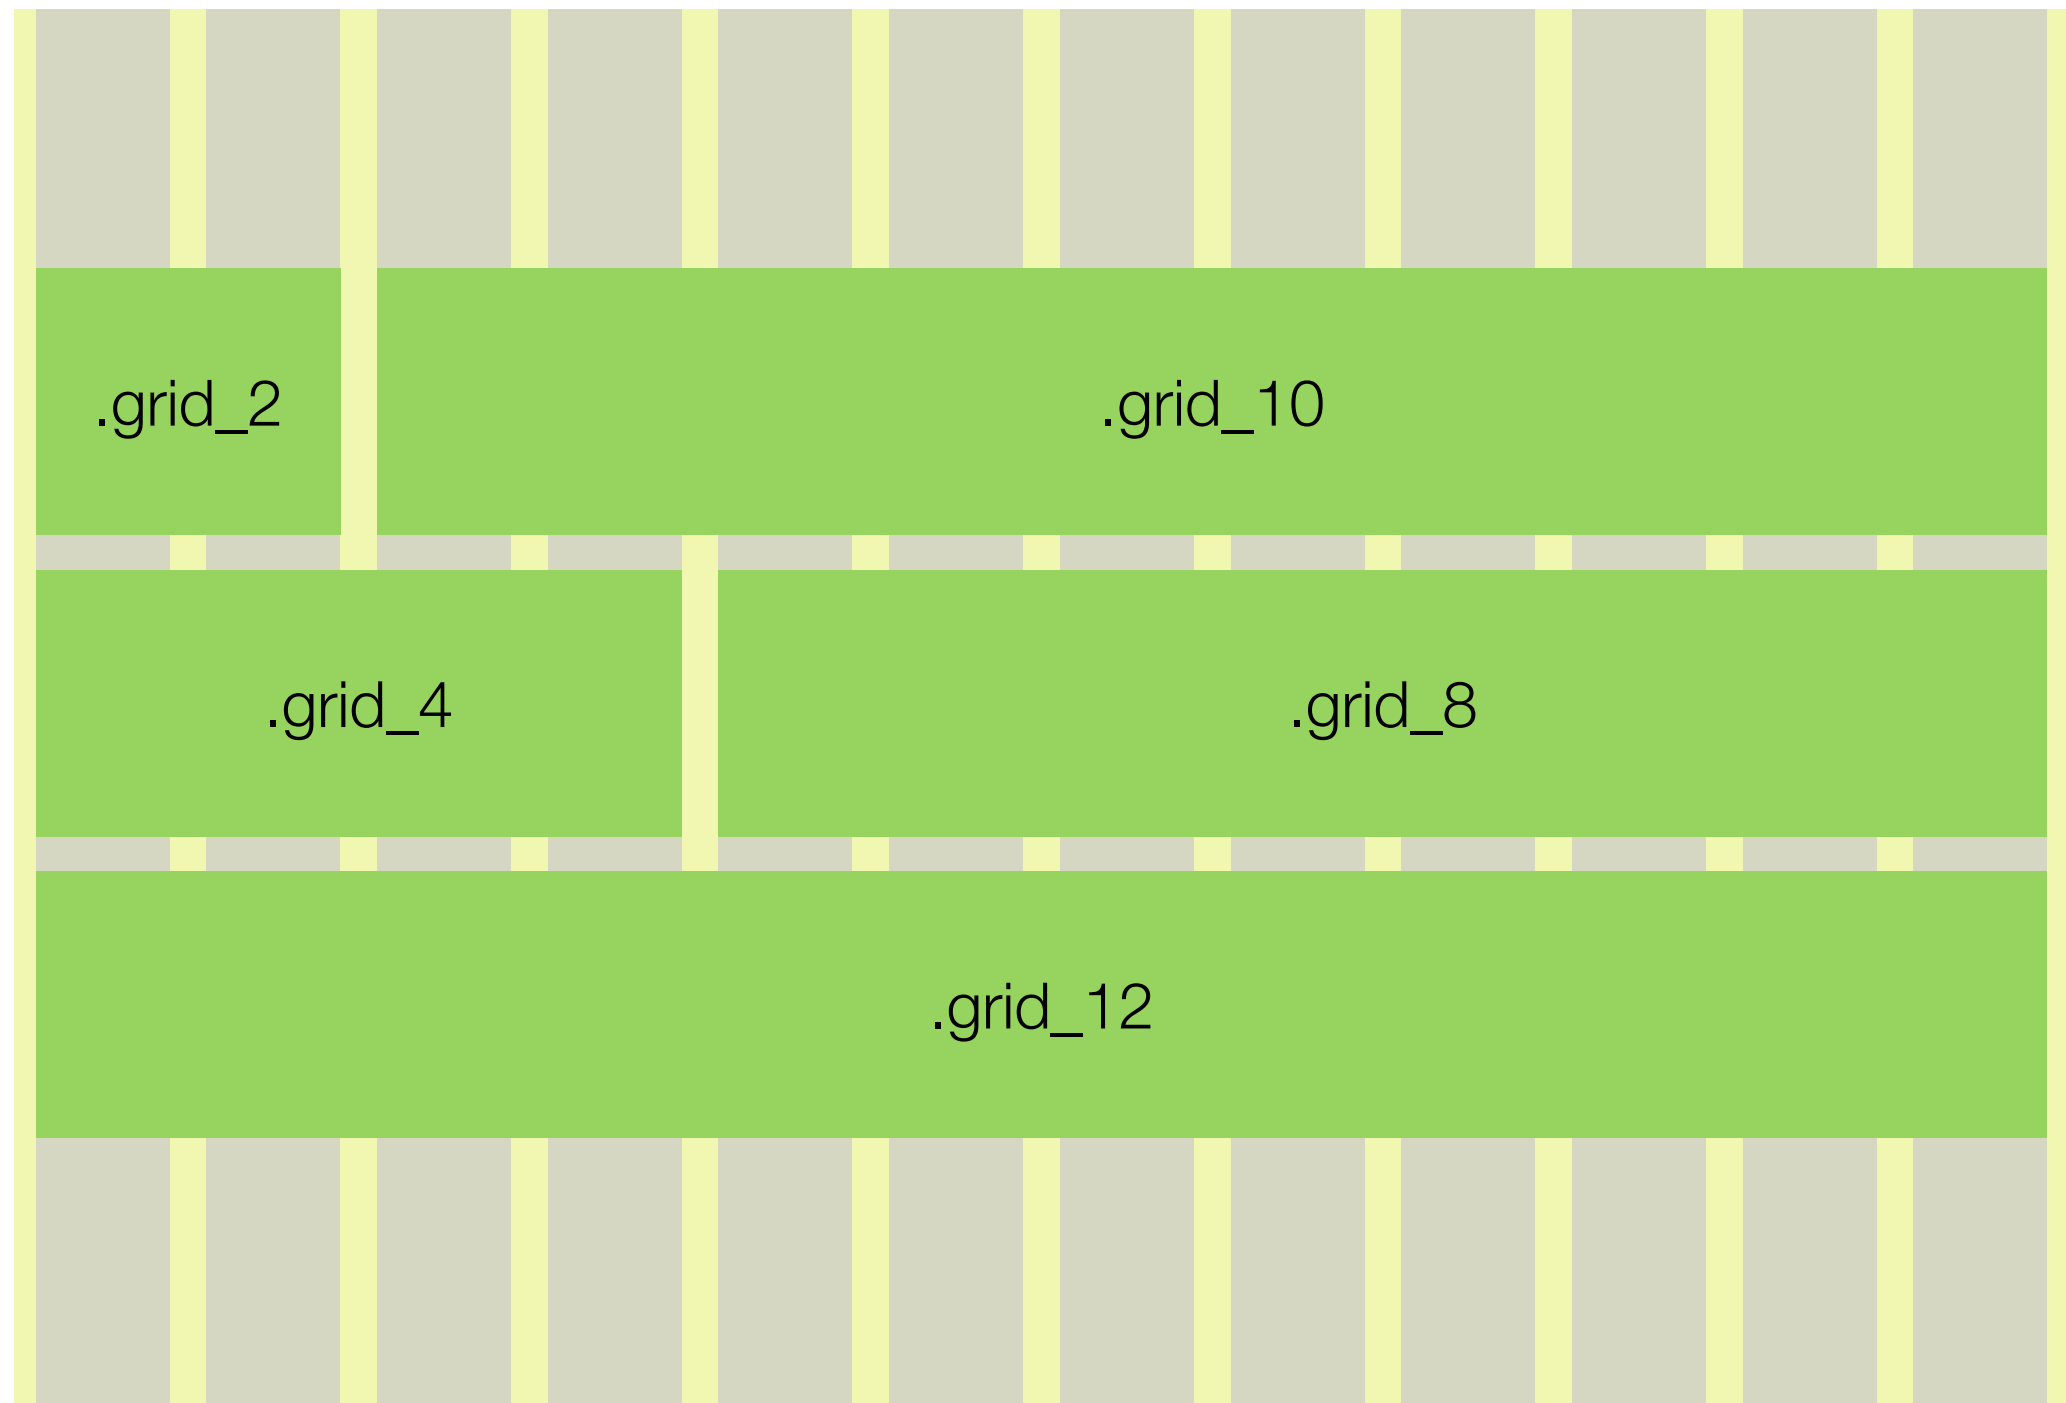

Grid basics: CSS sample

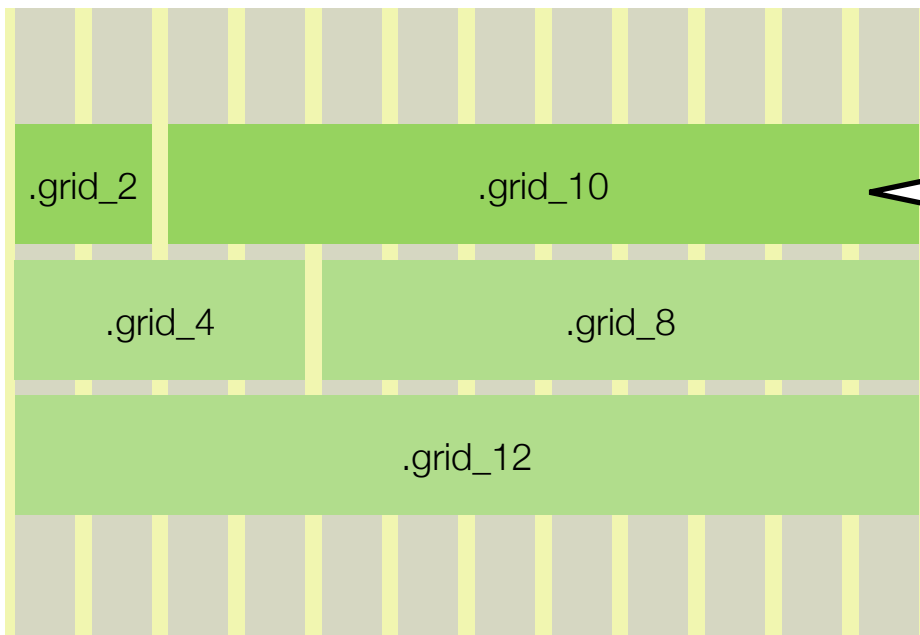

gutter

```
.container_1 {  
  width: 80px;  
  margin-left: 10px;  
  margin-right: 10px;  
  float: left;  
  ...  
}
```

Grid basics: layout (960.gs markup)

Grid basics: code (960.gs markup)

```
<div class="container_12">  
  <div class="grid_2">...</div>  
  <div class="grid_10">...</div>  
  <div class="clear">  
    ...  
  </div>
```

Grid basics: code (960.gs markup)

```
<div class="container_12">  
  <div class="grid_2">...</div>  
  <div class="grid_10">...</div>  
  <div class="clear">  
    ...  
  </div>
```

```
<div class="container_12">  
  <div class="grid_9 prefix_3">...</div>  
  <div class="clear">  
    ...  
  </div>
```

Grids are nice

- Easy to work with (clear markup)
- Layout rules are set for the whole team (designers, coders, themers)
- Great for prototyping
- Easy to replicate

Useful grid resources

- Grid generator for 960.gs, 1k grid, Golden Grid, Simple Grid:
<http://www.gridsystemgenerator.com/>
- Variable Grid System, an excellent 960.gs customizer / generator:
<http://www.spry-soft.com/grids/>
- Khoi Vinh and Mark Boulton's excellent design tutorial, Grids are Good.
- More Mark Boulton sessions at DrupalCon(s) are also nice (just google it).

Comic time! Real life example

There was this building... and a double bed.

The architect: happy!

Amazing! We have a great framework now.

Let's use it right away!

I mean everywhere!

The plan: it's perfect!

The mover guys: ready and skilled

Background voice:

The plan SRSLY
reminds of something

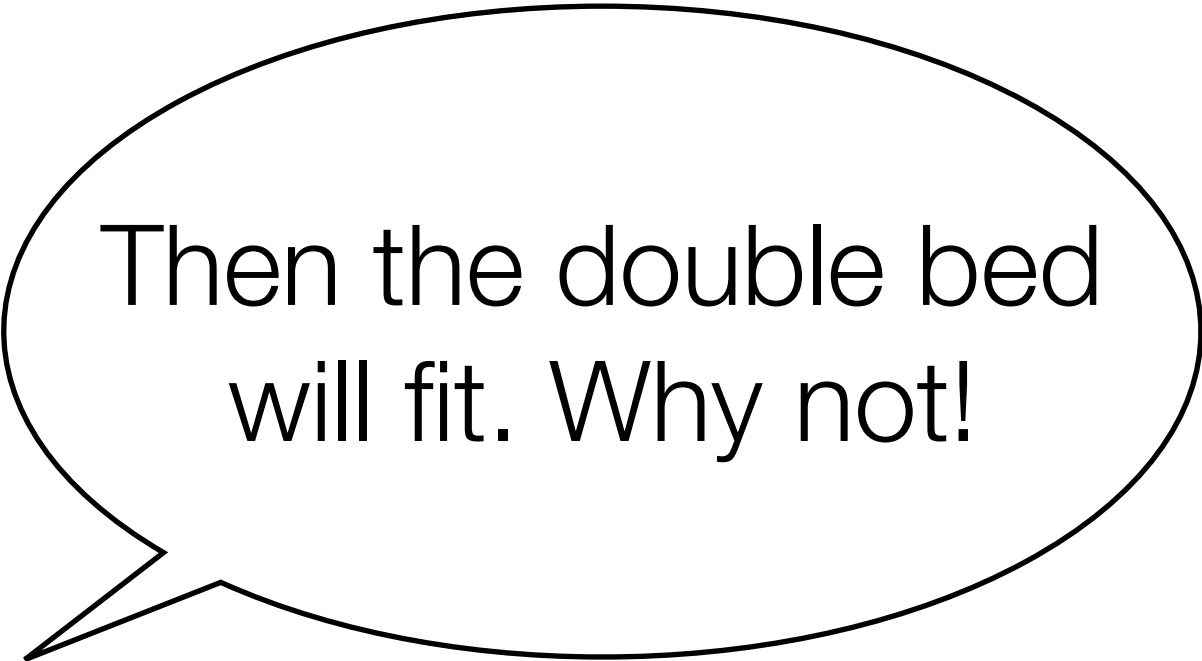

It's the GRID! Wow.

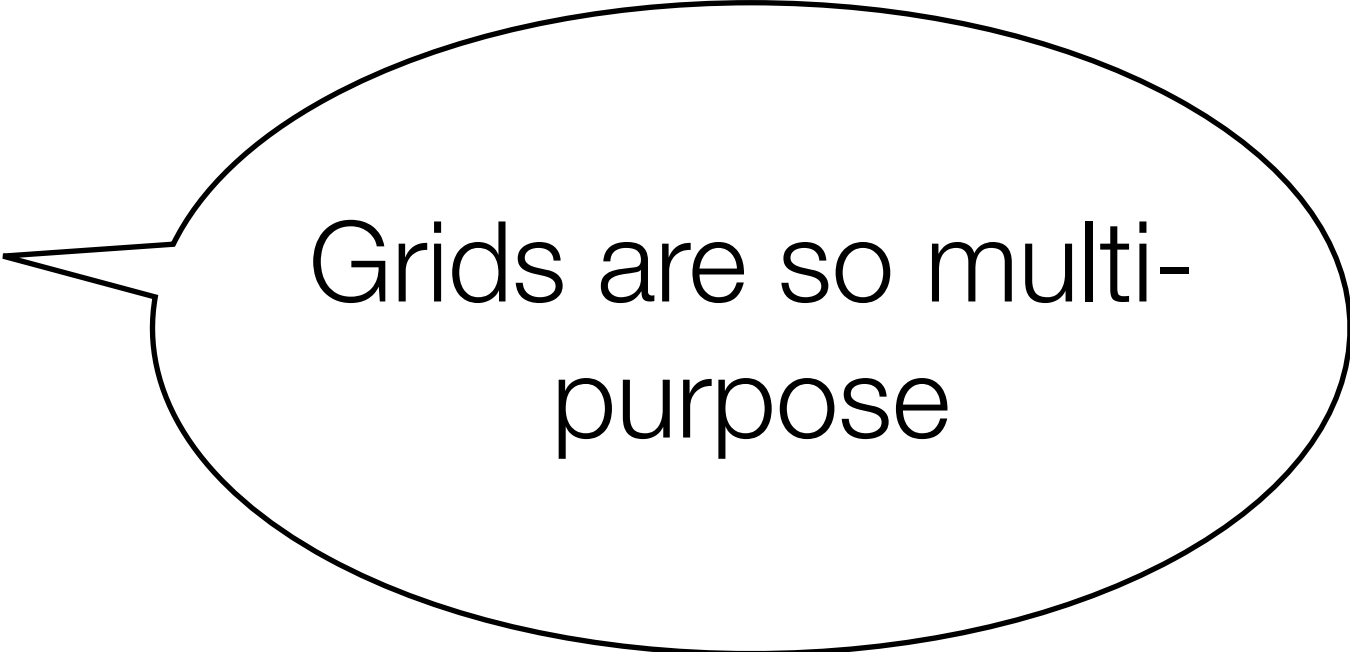

Well, yes, it's the grid

Background voice:

Then the double bed
will fit. Why not!

Grids are so multi-
purpose

The mover guys: on duty

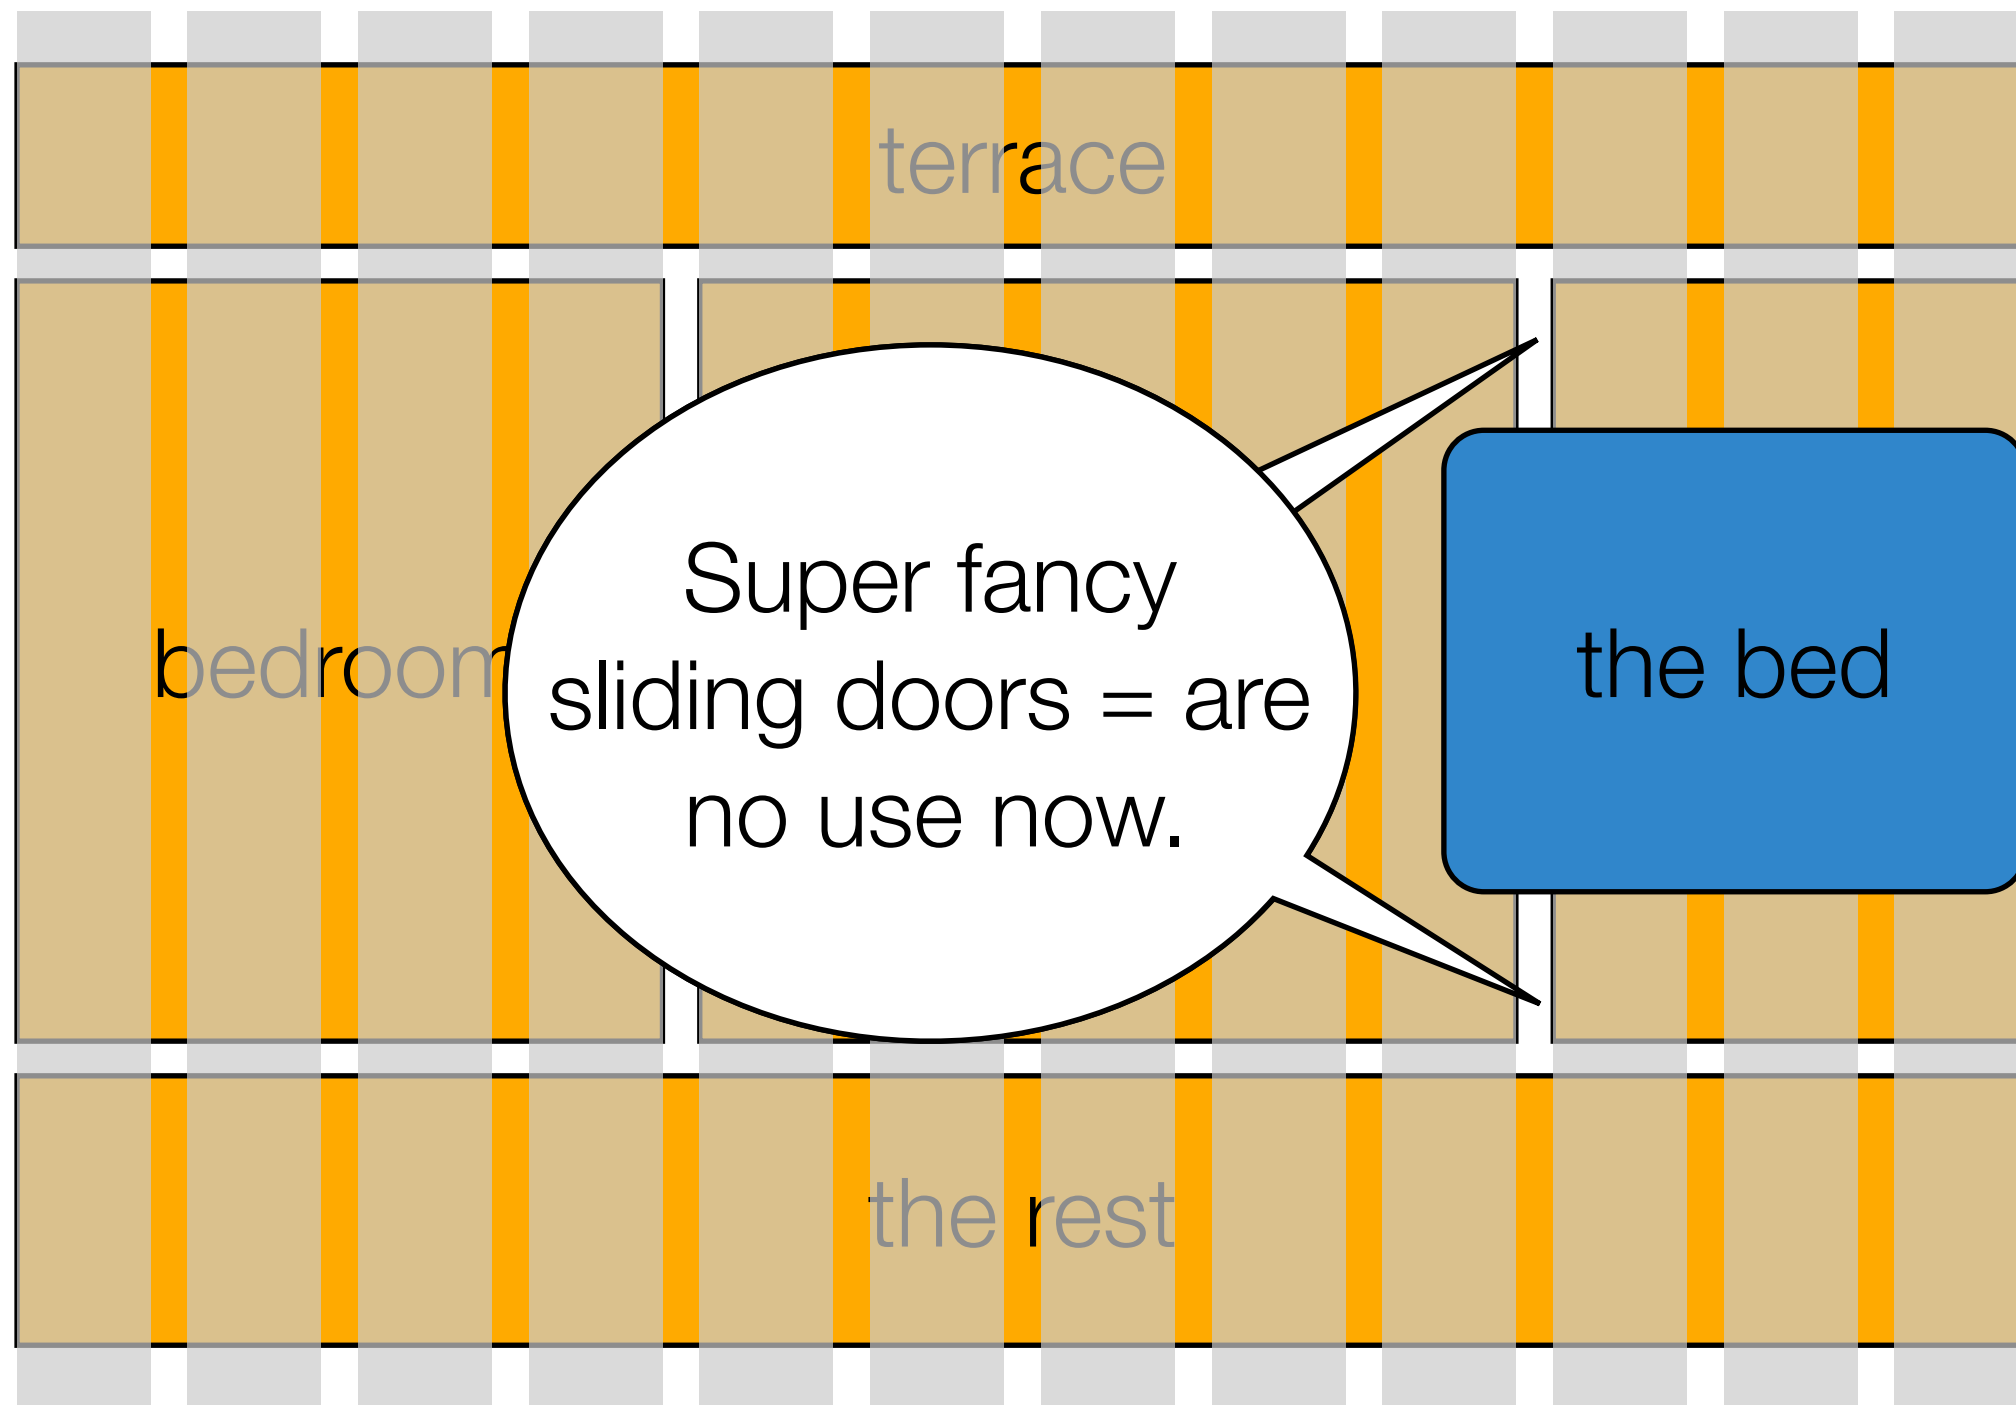

Oops, we've blocked terrace access

Something is sticking out

The result. It's not only ugly:

The mover guys: off duty

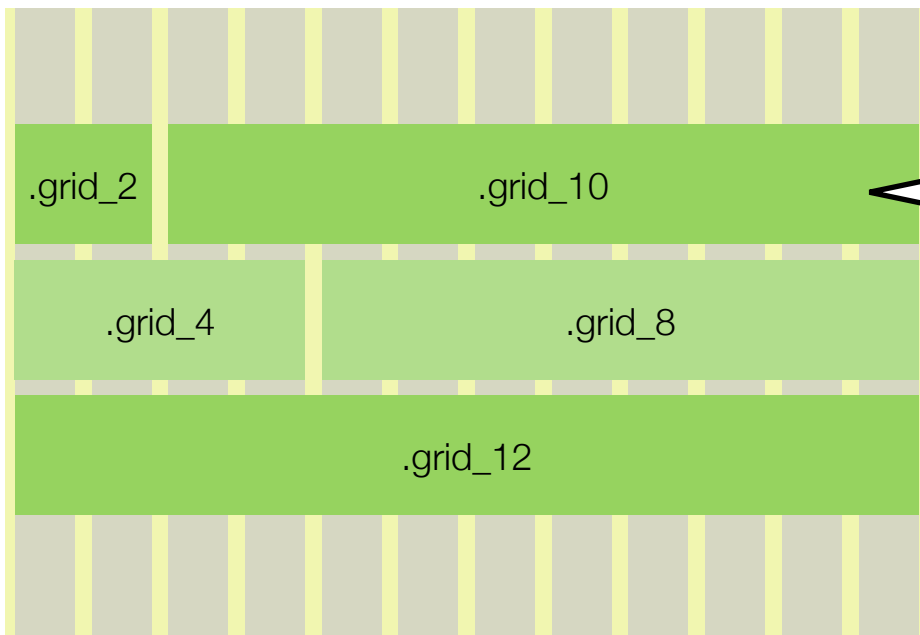

What's bad about grids

Things you have to keep in mind when using CSS grids

Grids are not semantic

- Out of the box grids are not semantic at all.
- Hard to read structure (for those who are not familiar)
- May affect mobile device browser behavior
- May affect screenreader rendering

Grids are not semantic: fixed

```
<div class="container_12" id="page-wrapper">  
  <div class="grid_2 sidebar">...</div>  
  <div class="grid_10" id="content">...</div>  
  <div class="clear">  
    ...  
  <div class="grid_12" id="footer">...</div>  
  <div class="clear">  
    ...  
</div>
```

Use case: upgrading old content

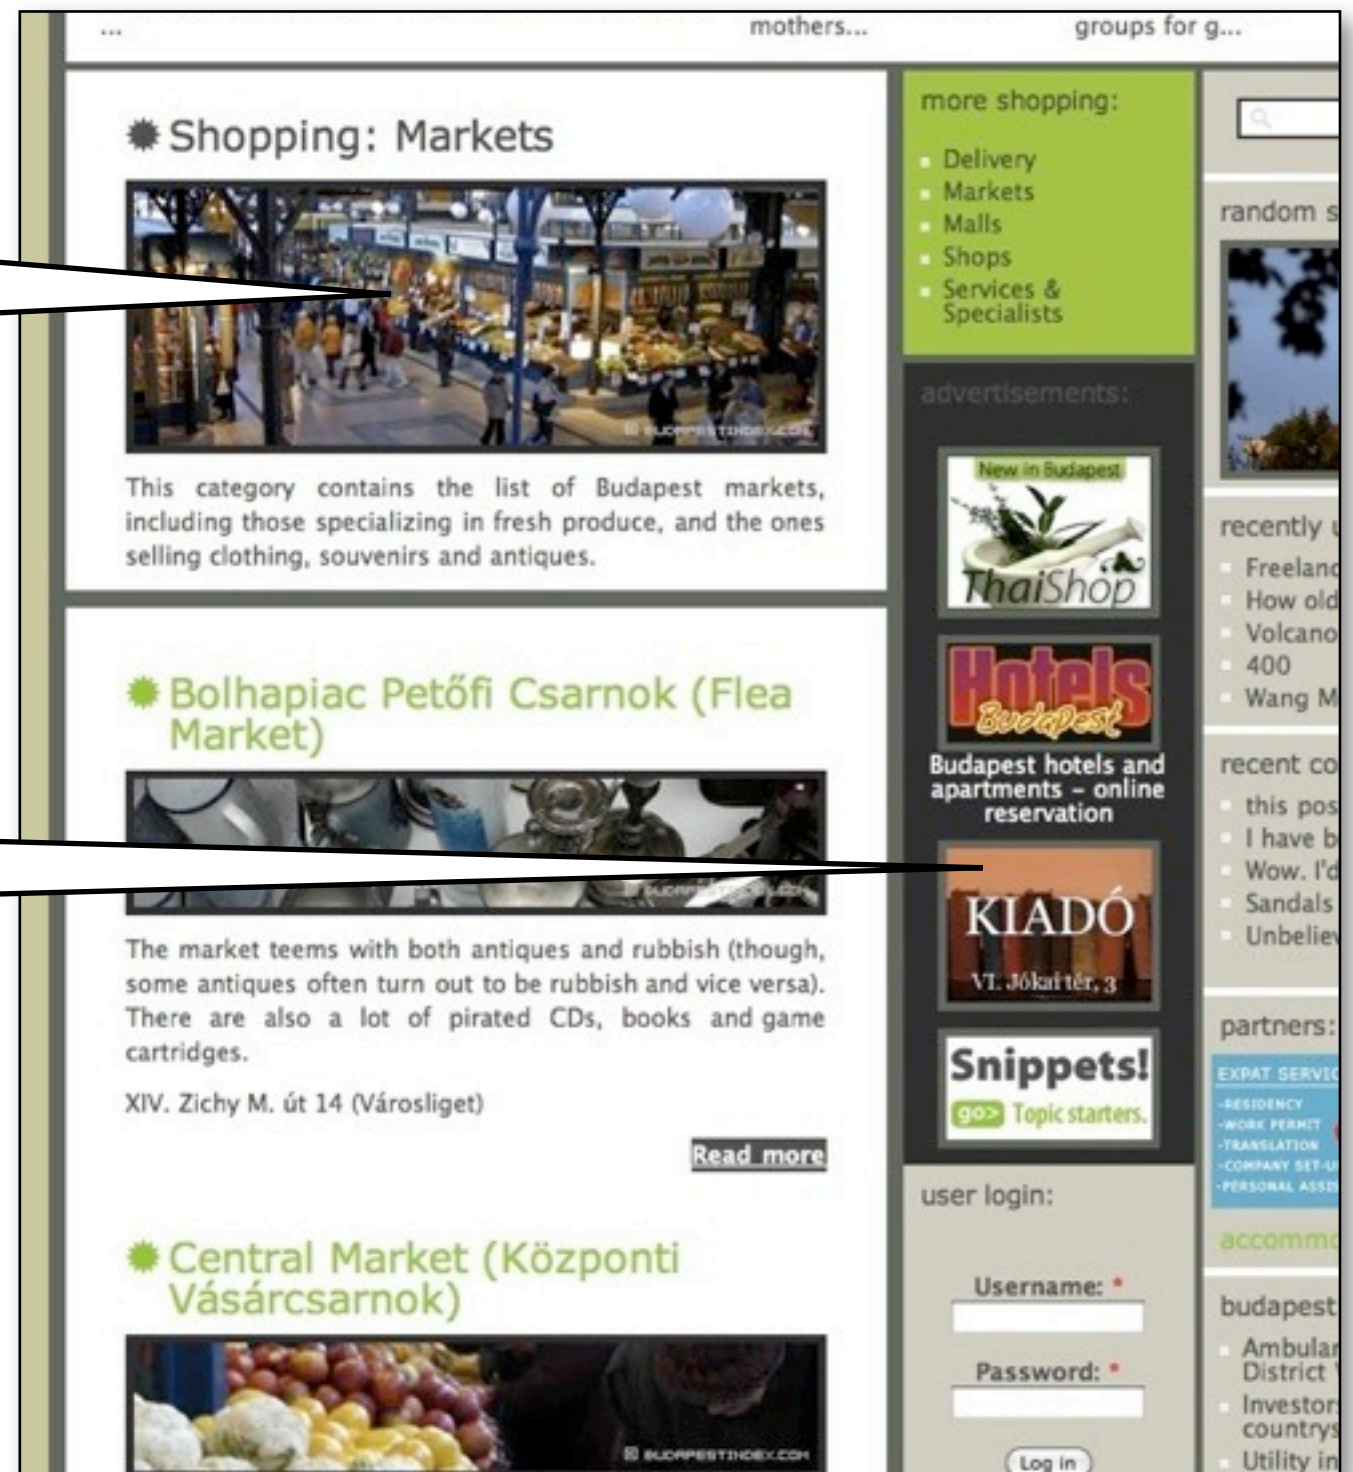

- <http://www.budapestindex.com/>
- The site was created 6 years ago.
- One of the major points back then was to fit content on 800x600 screens (as standard for internet cafes).
- More than 2000 images posted over years.

Use case: upgrading old content

Main image width is 400px. And will be kept this size.

IAB size ads and information banners. And IAB units are really hard to mix on grids without some sacrifices.

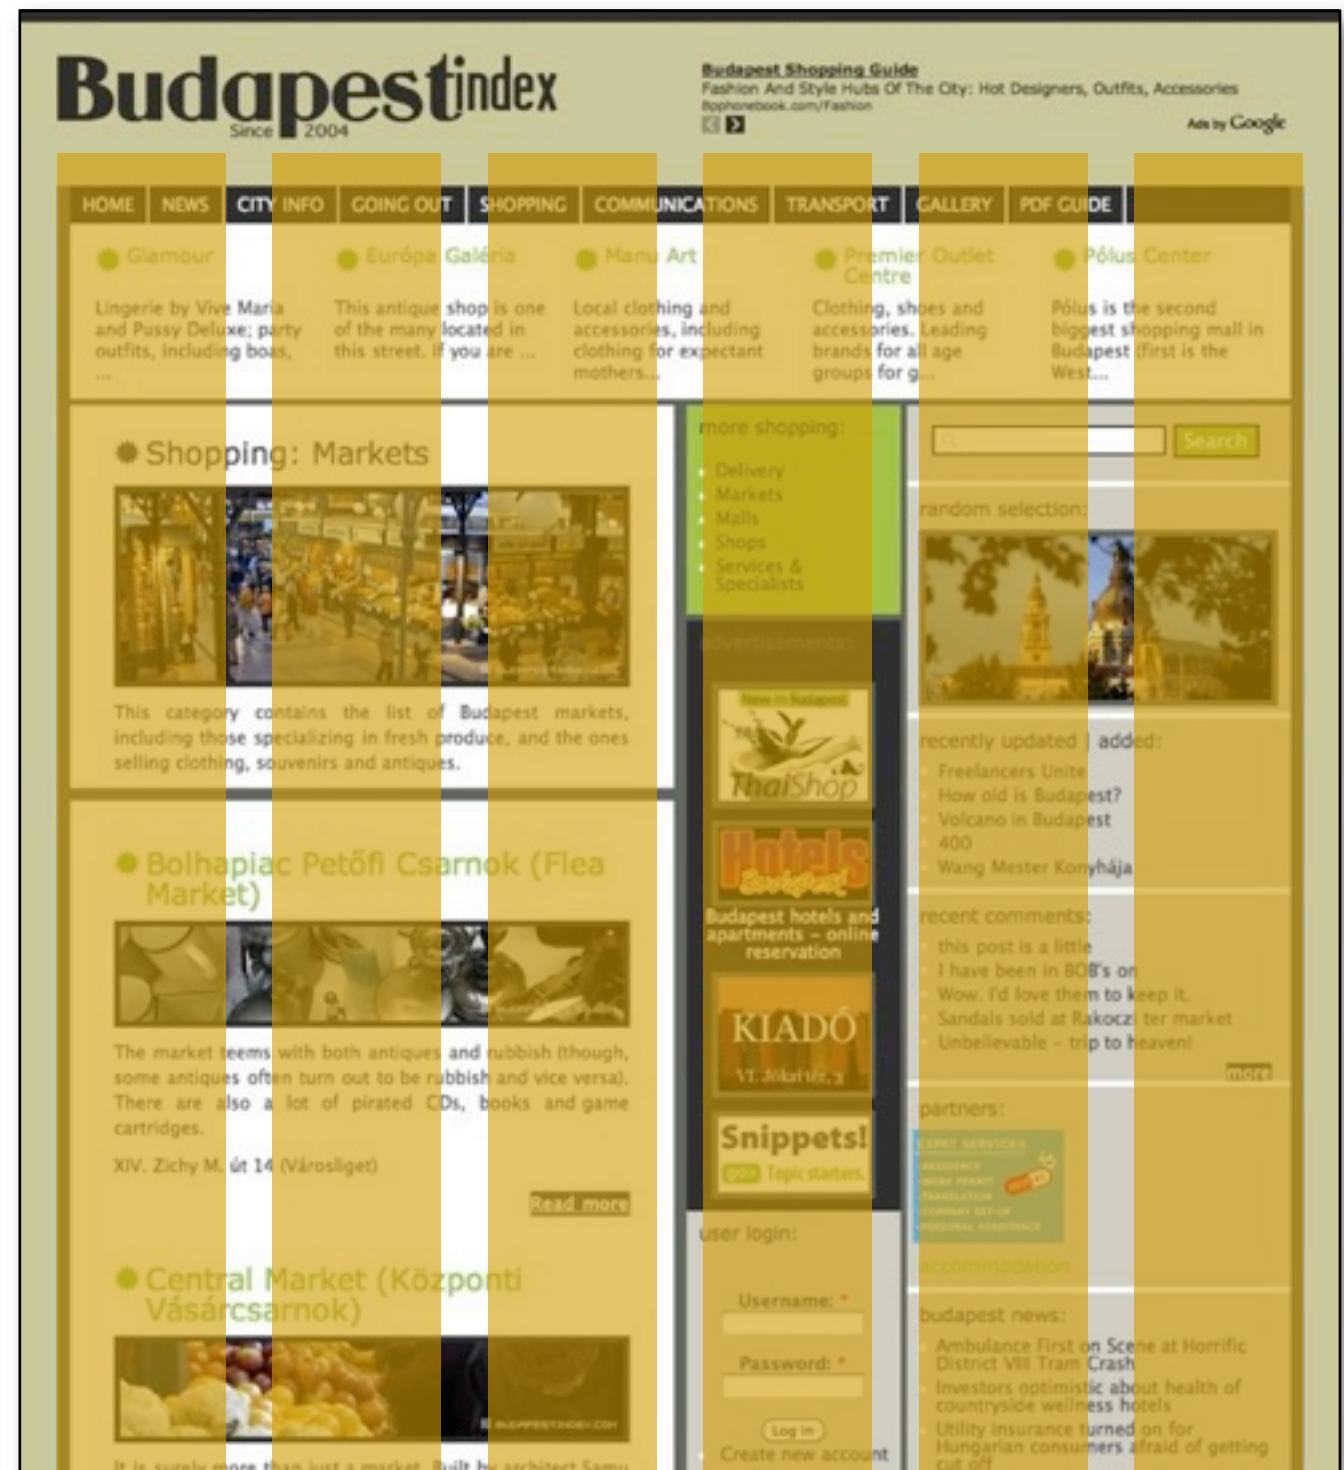

Use case: 12 column grid

- Let's try 12 column grid
- Almost fits to grid
- We might lose some nice existing margins

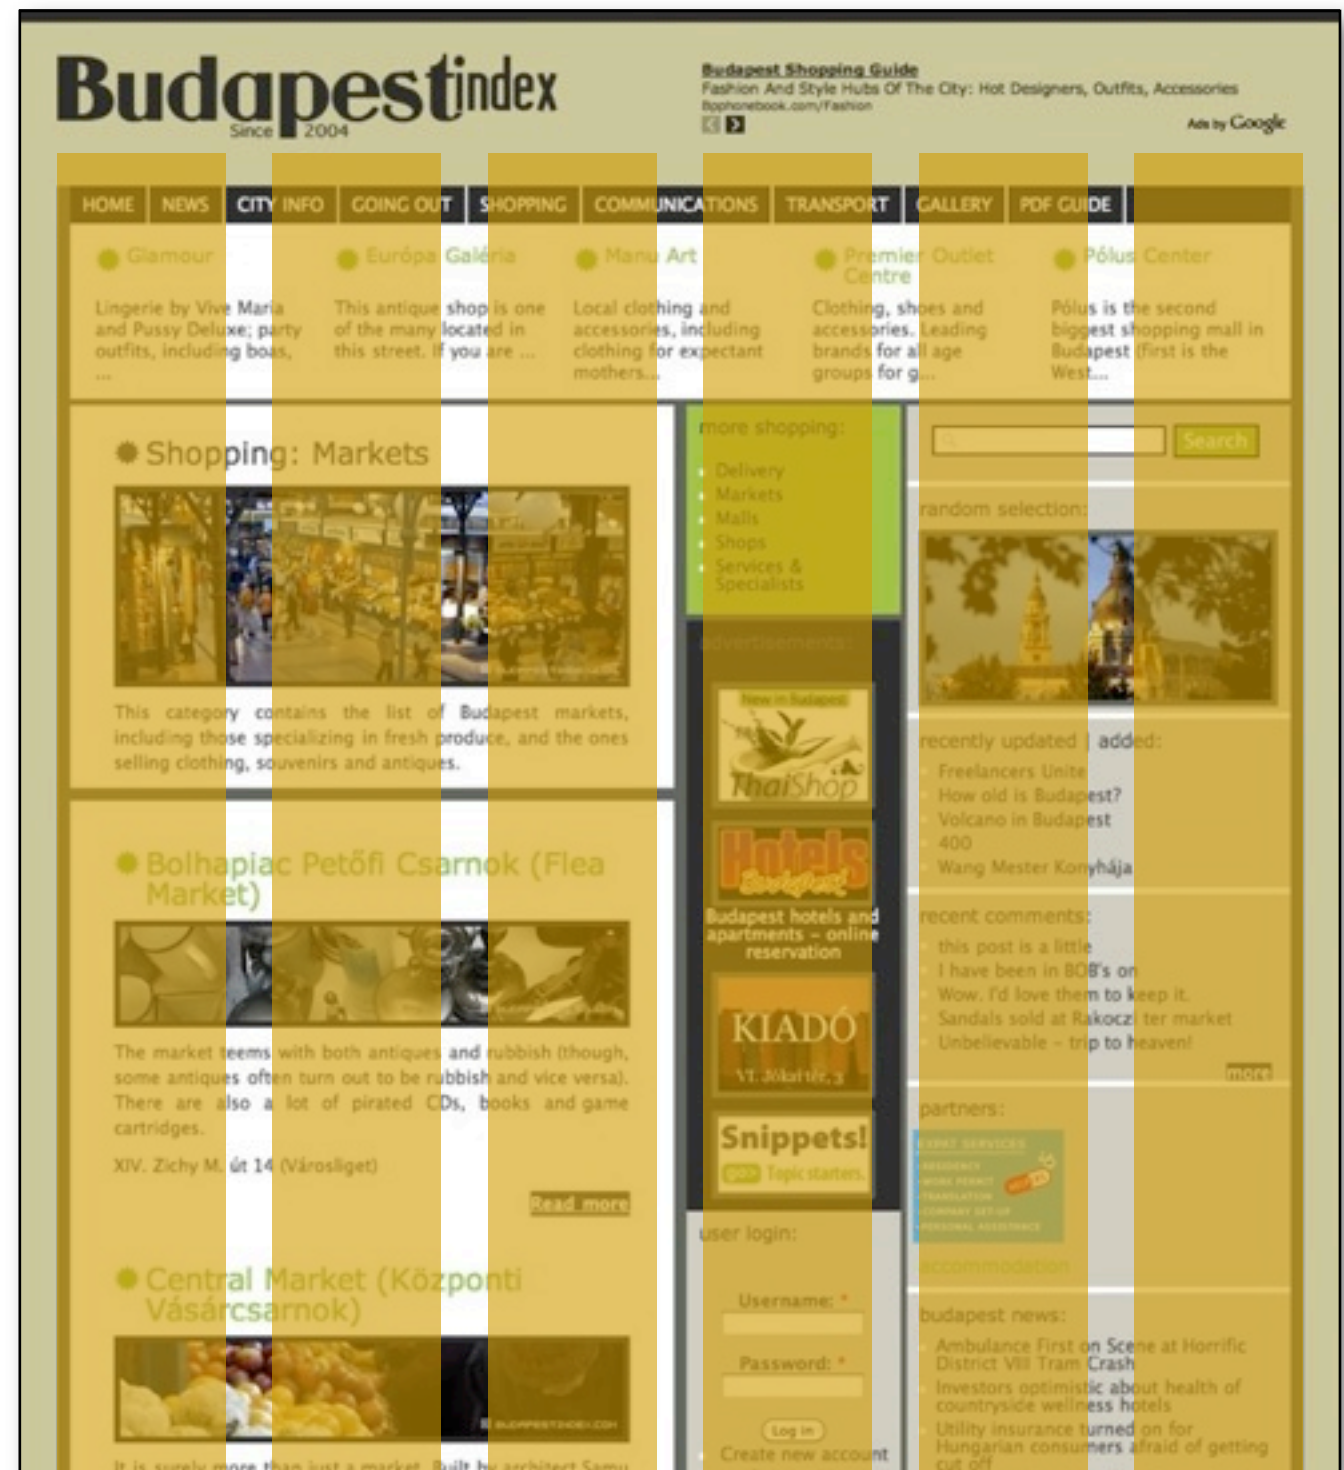

Use case: 6 column grid fits better

- 6 column will be just enough.
- Larger gutter will look nice to separate content.

Use case: 6 column grid fits better

- 6 column will be just enough.
- Larger gutter will look nice to separate content.
- But still... the grid is not so needed here!

Column count

How many columns we need?

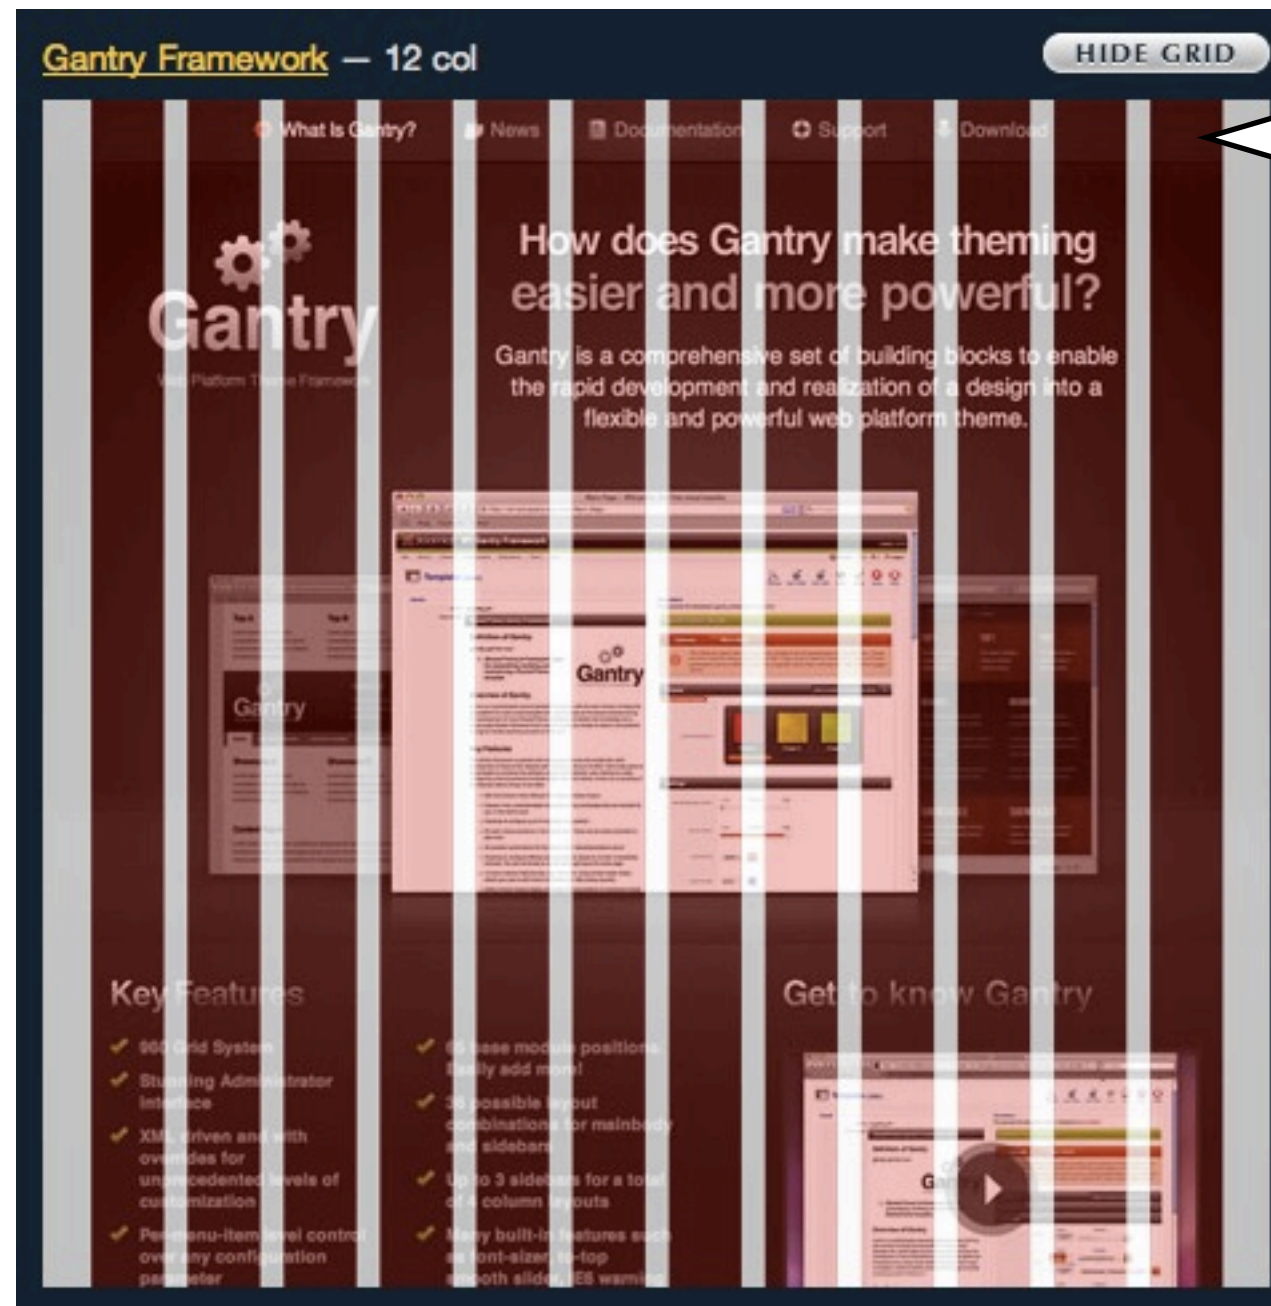

Columns to consume: 12

Perfectly aligned.
Even top navigation.

image source: 960.gs

Columns to consume: 12

Nothing is aligned.
Why would you need
grid here at all?

image source: 960.gs

Columns to consume: 16

Nice example in general.

But what is it sticking out?

image source: 960.gs

Columns to consume: 24

Blueprint Tests: grid.css

Wow!

1 2 3 4 5 3

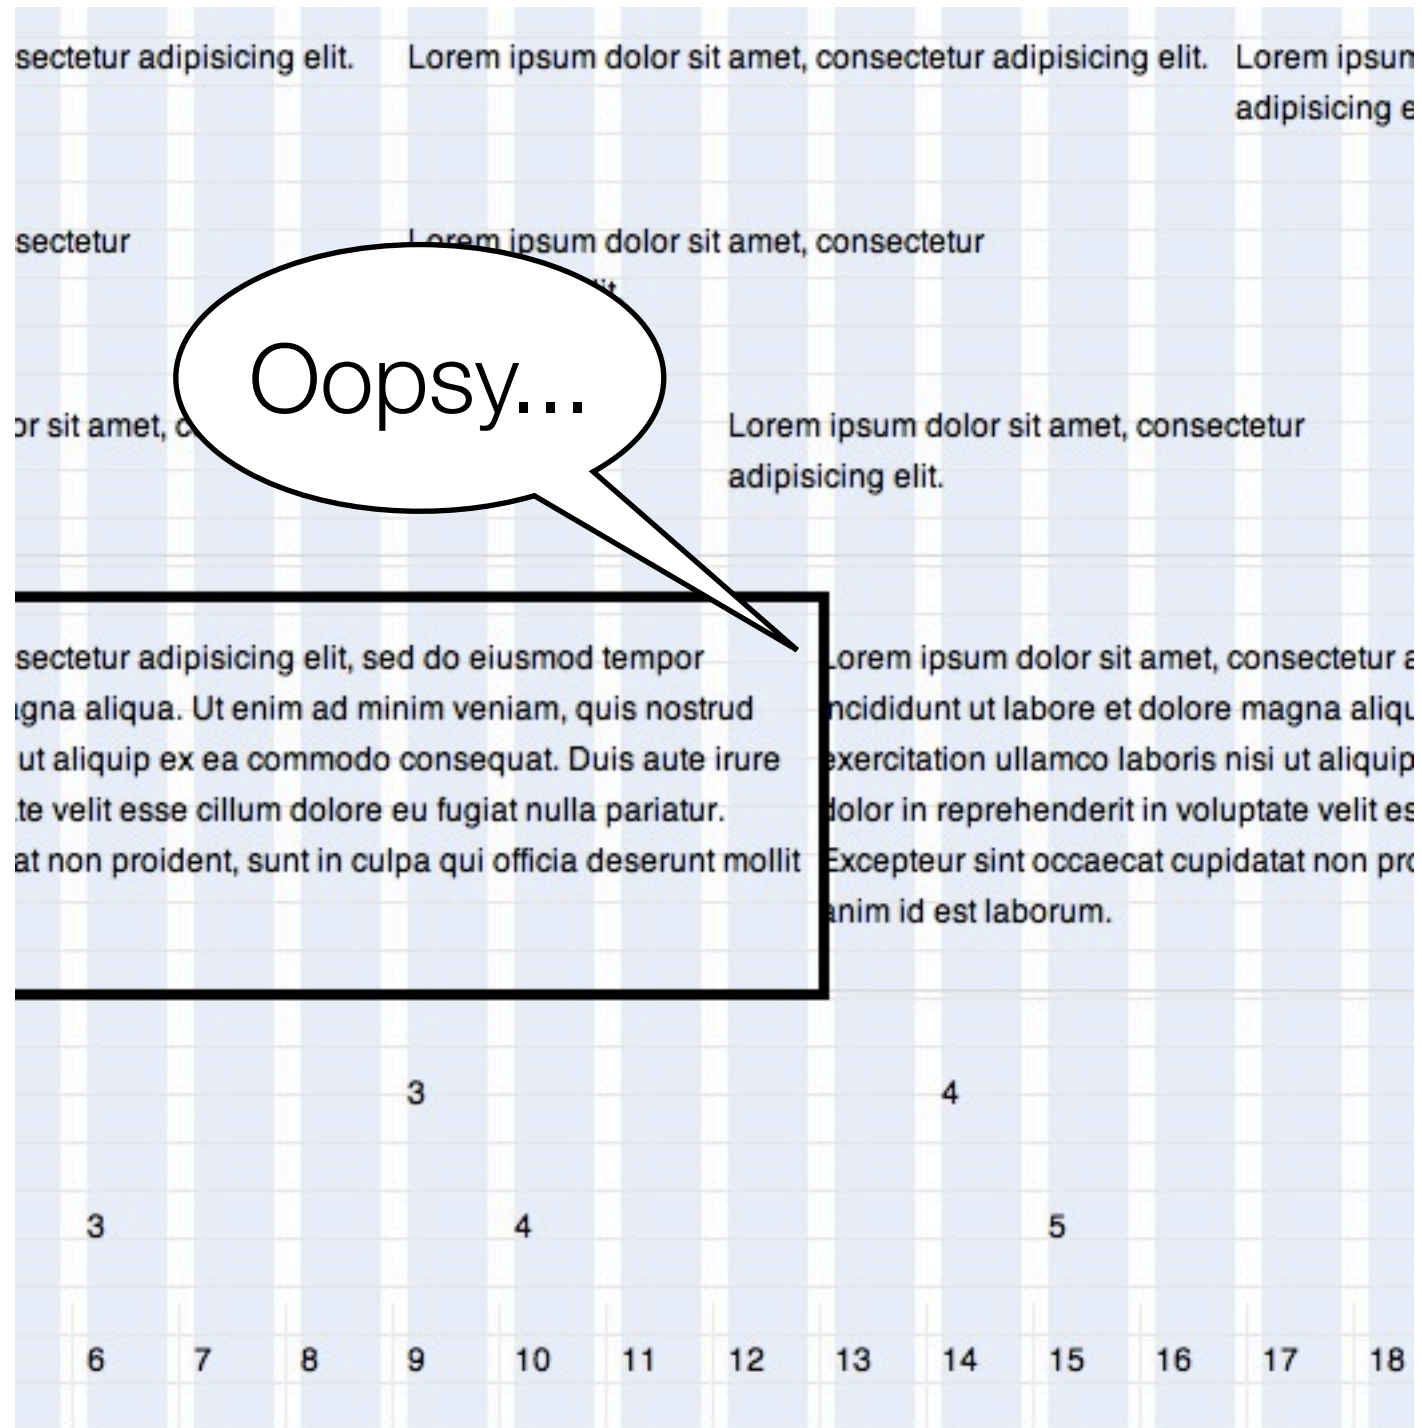

1 2 3 4 5 3

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24

1 2 3 4 5 6

2 23 24

Columns to consume: 24

Let's go extreme: 320 columns!

- Well, we can: http://www.spry-soft.com/grids/grid/?column_width=2&column_amount=320&gutter_width=1
- But it makes no sense (or actually it's nonsense).

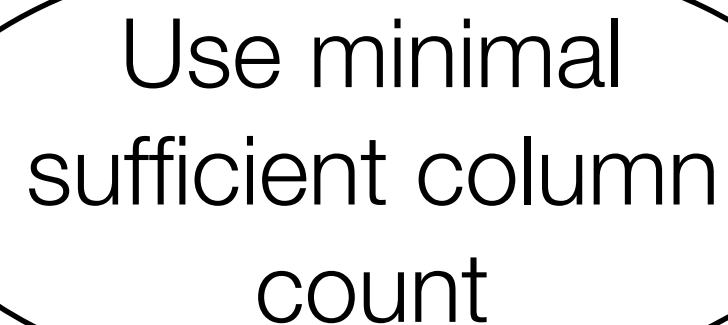

Best column solution:

Check in with
designer

Roll your own

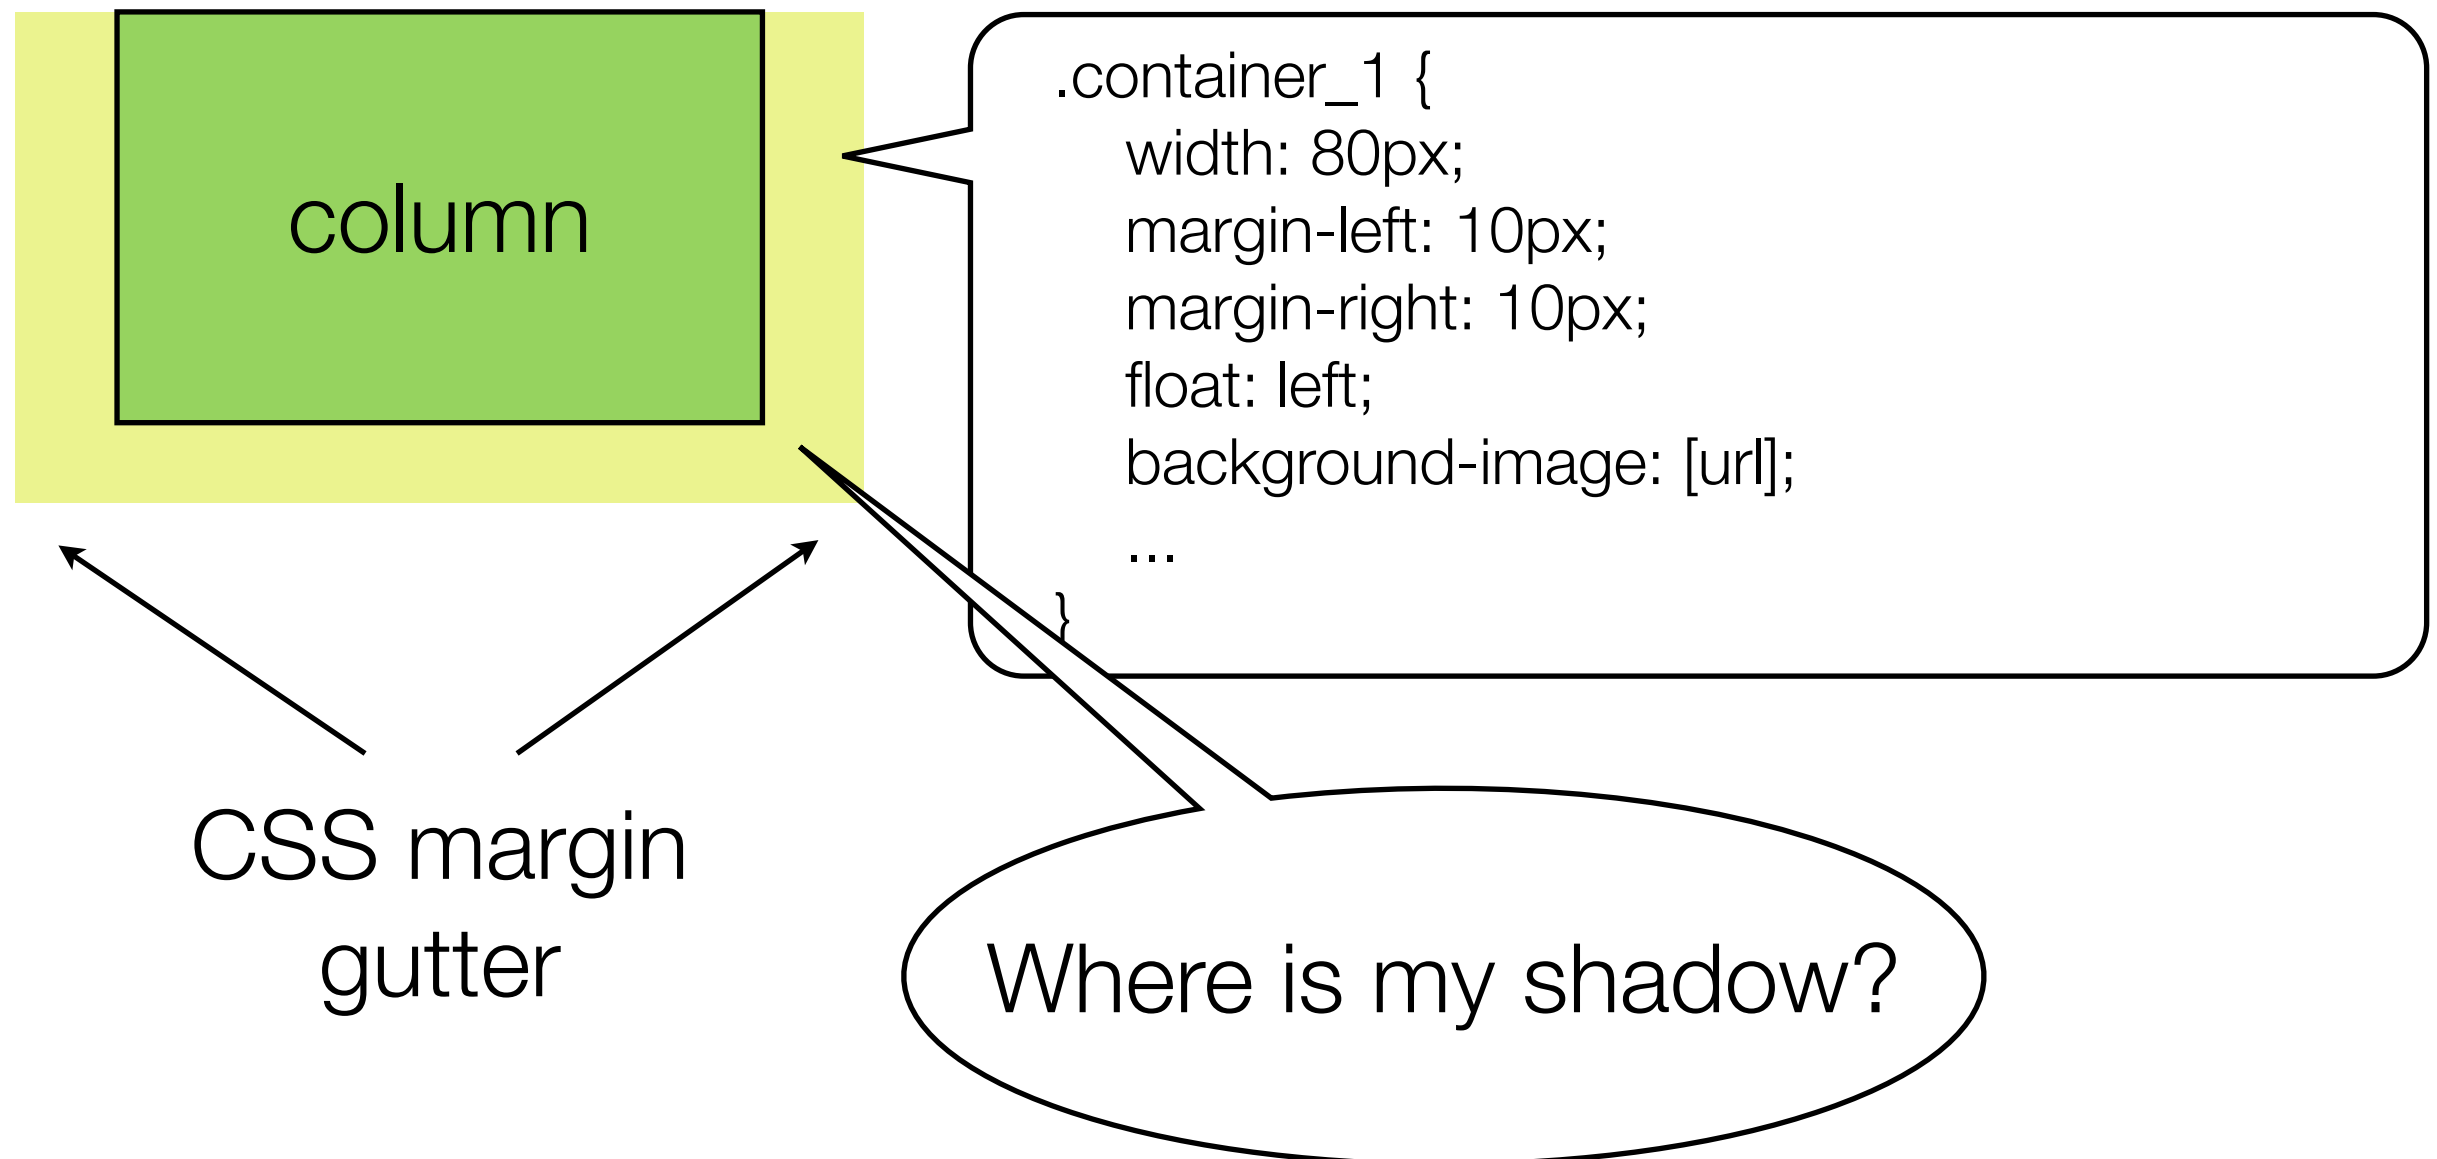

Use minimal
sufficient column
count

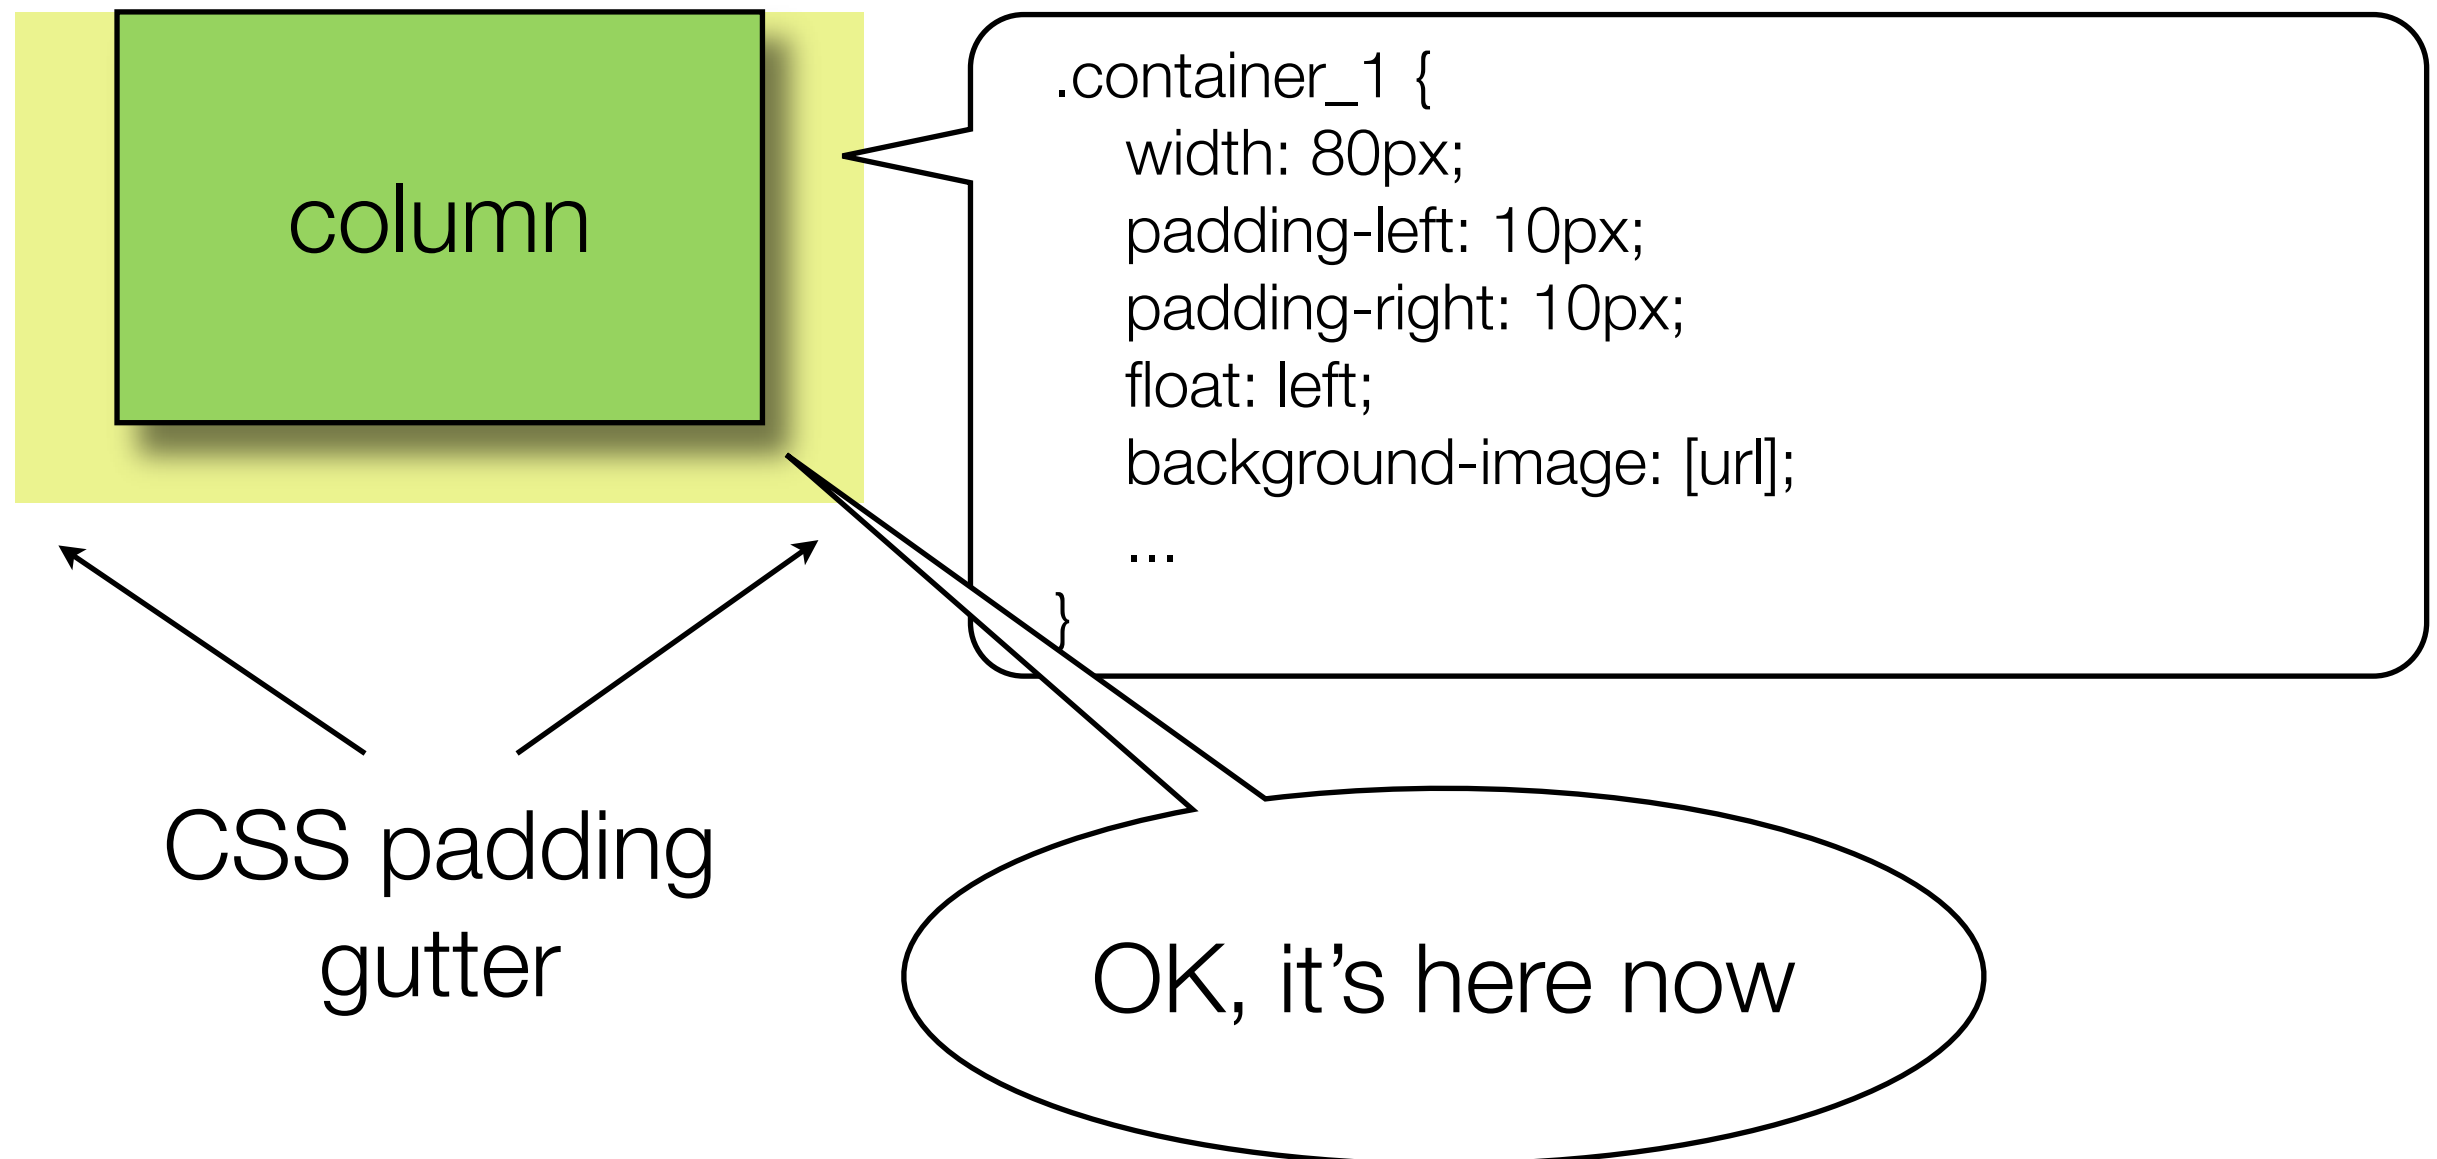

Gutter model

margin vs padding

Gutter model: CSS margin

Gutter model: CSS padding

IE6/7 CSS Issues

- There will be a few depending on exact grid framework.
- Hurray! We have IE fix in separate CSS file!
- But IE can handle only about 30 CSS links (including @links in CSS).
- Advanced Drupal site can have “slightly” more CSS files than that.
- Some will have IE issues some not.
- Why would you care about IE6? In many corporations it is still the default one with up to 60% users (esp. in finance).

The bottom line

- Grids are nice for communicating design and layout as well as for prototyping.
- Grids may become a trouble in many cases if used with (just!) default settings/code.
- Create and use the your own grid for your team or even a project.

That's it for now.

Whoat? Just testing
new layout model...
